

Other: Server Settings

This article gives a general overview of our server settings for devices that may require them (printers, copiers, scanners) as well as provide general guidance.

User Settings:

Email Address **yourEmail@yourWebsite.com**

Username **yourEmail@yourWebsite.com**

Password **yourEmailPassword**

If the device you're trying to setup is requesting an incoming or IMAP server, you should use the settings below. We **strongly** recommend using IMAP (SSL) whenever possible.

Inbound Servers:

Type	Server Address	Port
POP Server (SSL)	secure.emailsrvr.com	995
IMAP Server (SSL)	secure.emailsrvr.com	993

If the device you're trying to setup is requesting an outgoing or SMTP server, you should use the settings below. We **strongly** recommend using SMTP (SSL) whenever possible.

Please note: Our SMTP servers require authentication. Which means you need to enter username

and password to send through our network. We do not allow unauthenticated open relays to send through our servers. If your device does not support SMTP Authentication, you will not be able to use our settings. Please consult with the device manufacturer on whether your device supports SMTP authentication.

Outgoing Servers:

Type	Server Address	Port
SMTP Server (SSL)	secure.emailsrvr.com	465
SMTP Server (Non-SSL)	smtp.emailsrvr.com	25, 587, 8025, 2525

**For non-SSL SMTP, you can use any of the ports listed. Some networks block port 25, which is why we provide the alternate ports.*
